Job Market Paper

Of Fathers and Farms: How Intergenerational Persistence Shapes Structural Transformation

Abstract. The transmission of skills and preferences from parents to children leads to intergenerational persistence in sector choice. How do these inherited connections alter the process of structural transformation? Using linked father–son records in census microdata, this paper establishes that both inherited skills and inherited preferences are important sources of persistence in the United States between 1880 and 1940. Embedding these findings into a macroeconomic model of structural change, the paper shows that intergenerational persistence slowed the process of U.S. industrialization by 14.3 percent. Inherited skills account for nearly all of this slowdown because their immediate and dynamic effects reinforce each other, whereas those of inherited preferences largely offset. Accounting for persistence also implies substantially greater agricultural technology growth relative to nonagriculture than a model without persistence would infer from the same historical transition.
